

HCA Tech Note 114

Command Line Options

There are several command line options for HCA and the HCA Windows client. These are:

`/HCAServer:###.###.###`

Provide the 4 part IP address of the server

`/HCAServerName:<string>`

Provide the DNS name of the HCA Server

`/Port:#`

Provide the port # to use for connections to the server

`/Pswd:<string>`

Provide the remote access password to use during connect

Each of these acts as an override of the same parameter in the HCA Options Client-Server settings. Those settings are not modified using these. If a connection parameter isn't provided on the command line, then that HCA Options parameter is used.

These are very handy when creating desktop shortcuts.
